

Care Instructions for Tillandsia

Tillandsias are air plants. They do not need soil to live. They are easy to care for and don't require much maintenance.

- Lighting: Should be bright but filtered (not direct sunlight). They can be grown in a windowsill no further than 2 feet away from a window.
- Water: Spritz the entire mounted tillandsia 2-3 times per week; more if you're in a hot and dry area and less if it's cool and humid. Plants need air circulation and should not remain wet a few hours after watering. DO NOT over water and allow the tillandsia to be constantly wet or sitting in water.
- Temperature: Optimal temperature range is 50-90F.
- Fertilize: You can use a bromeliad fertilizer (17-8-22) twice a month. Or other water-soluble fertilizers are sufficient at ¼ strength.
- As the tillandsia grows, it will put out a flower. If the plant gets too large you can remount the tillandsia onto a bigger wood piece, rock, seashell, etc. Use water soluble glue such as E-6000 adhesive.
